Tool Area Guards

SMV Tool Area Guards

SMV Industrier has developed a universal Tool Area Guard that allows easy component ejection from the front, rear and side of the press.

SMV design department has paid attention to the demands that the system should be easy to handle and quick to adjust between the different options.

The system works as follows: The front and rear of the press is supplied with hinged opening doors that are electrically interlocked. The outgoing side of the press is a fixed guard and is also electrically interlocked. The two doors and the fixed guard have rectangular opening for component ejection.

This option is supplied with two adapter plates and one ejection chute, all are electrically interlocked.
